How do I solve quadratic equations step by step?

I have my BECE exam in 2 weeks and I'm really struggling with quadratic equations. My teacher explained the formula method but I still get confused with the steps. Can someone please break it down for me with a clear example? I would really appreciate any help! 🙏

Great question, Fatmata! 🙌
To solve quadratic equations ($ax^2 + bx + c = 0$), use the quadratic formula:
$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Step 1: Identify a, b, and c from your equation
Step 2: Calculate the discriminant ($b^2 - 4ac$)
Step 3: Substitute into the formula
Step 4: Solve for both values of x
